abbreviation	Description
ylog	your log

Revision	Author	Date	Brief
1.0	Luther Ge	2016/02/14	Initial Draft
1.1	Yanli Chen	2016/03/02	Add ylog use help
1.2	Yanli Chen	2016/03/28	Add ylog_cli at/print2android/print2kernel cmd
1.2e	Yue Zhao	2016/03/29	Translate to English
1.3	Yanli Chen	2016/04/01	Add modem/wcn log speed statistics

1. ylog 设计框架

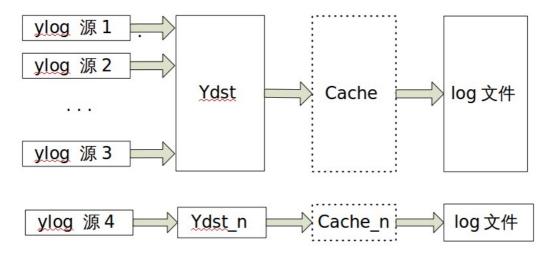

ylog(your log)是可定制的后台常驻服务程序,用于完成 log 收集、智能解析、行为统计等

1.1 ylog 结构设计

ylog 服务程序被设计为 3 部分: ylog 源, ydst 和 cache

ylog 源:数据输入源 ydst: 数据输出

cache:用于缓存输出数据

1.1.1 ylog 源

1.1.2 ydst

ydst 专注在数据输出,从 ylog 描述的输入获取到的数据将被传递给 ydst , ydst 将对数据进行 segment 大小和段个数控制,同时如果数据流量比较大,可以考虑为 ydst 挂靠 cache , 来缓解大数据、大吞吐下数据因为磁盘短暂效率问题而出现的数据丢失 ydst 参考形式如下:

```
SPREADTRUM<sup>®</sup>
```

```
[OS_YDST_TYPE_ANDROID] = {
    .file = "android/",
    .file_name = "android.log",
    .max_segment = 30,
    .max_segment_size = 50*1024*1024,
    .cache = &os_cacheline[OS_YDST_TYPE_ANDROID],
},
```

1.1.3 cache 缓存

cache 专注在 ydst 数据输出如何被缓存,随后择机写入磁盘存储,为了保证尽快回写磁盘, cache 有一个 timeout 属性,用来定义一种行为: cache line 如果在 timeout 内仍未填满,那么 cache line 中数据将被强行 flush 回磁盘

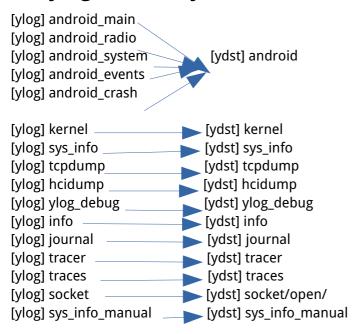

```
[OS_YDST_TYPE_ANDROID] = {
    .size = 512 * 1024,
    .num = 4,
    .timeout = 1000, /* ms */
    .debuglevel = CACHELINE_DEBUG_CRITICAL,
}
```

2. ylog 模块

ylog 是在 init.rc 中启动的一个用户空间的服务程序,persist.ylog.enabled 属性值可以辅助控制开机后 ylog 默认启动行为。ylog 模块不仅支持多个 ylog 源并行输入,还支持多个 ydst 并行输出。根据 ylog 源数据结构,指定 ydst 输出,并设定 ydst 输出是否挂靠 cache、重启时间间隔、达到段上限值后是否进行覆盖等

2.1 ylog 输入源与 ydst 对应列表

2.2 ylog 输入源

1、android 类

包含 android_main、 android_radio、 android_system、 android_events、 android_crash 等五类 log , 共同输出到一个 ydst 中,为了提高磁盘效率,此 ydst 默认挂靠 2M 大小的 cache

2、kenel

收集 kernel log, kernel ydst 默认挂靠 1M 大小的 cache

3, sys_info

定期(2分钟)收集系统相关 log, 具体包括以下信息:

/proc/slabinfo

/proc/buddyinfo

/proc/zoneinfo

/proc/vmstat

/proc/vmallocinfo

/proc/pagetypeinfo

/sys/module/lowmemorykiller/parameters/adj

/sys/module/lowmemorykiller/parameters/minfree

/proc/wakelocks

/d/wakeup sources

/sys/class/backlight/sprd_backlight/brightness

/sys/kernel/debug/binder/failed_transaction_log

/sys/kernel/debug/binder/transaction_log

/sys/kernel/debug/binder/transactions

/sys/kernel/debug/binder/stats

/sys/kernel/debug/binder/state

/sys/kernel/debug/sprd_debug/cpu/cpu_usage

4, tcpdump

用于收集 ap cap log, tcpdump ydst 默认挂靠 1M 大小的 cache

5, hcidump

用于收集 hci bt log, hcidump ydst 默认挂靠 1M 大小的 cache

6, ylog debug

用于收集 log 相关的调试信息,包含 log 速率,空间使用、运行状态等信息,每 20 分钟统计一次

/system/bin/ylog_cli ylog

/system/bin/ylog_cli speed

/system/bin/ylog_cli space

getprop ylog.killed

7、info

用于收集系统相关静态信息,只会在 ylog 启动时捕获一次

/proc/cmdline

/proc/version

/proc/meminfo

/proc/mounts

/proc/partitions

/proc/diskstats

/proc/modules

/proc/cpuinfo

/default.prop

/data/ylog/ylog.conf

Is -I /

Is -I /dev/block/platform/*/by-name/

Is -I /dev/

getprop

cat /*.rc

ylog 所有线程 pid 和 tid

8, journal

```
at /data/ytog/ytog_journat_file

[01-01 08:06:35.701] ylog.start success - up time: 00:06:37, idle time: 00:05:05, sleep time: 00:01:50

[01-01 08:06:55.249] ylog.start success - up time: 00:00:05, idle time: 00:00:10, sleep time: 00:00:00

[01-01 08:07:47.919] ylog hcidump start
 [01-01 08:18:02.044] ylog.start success - up time: 00:00:04, idle time: 00:00:09, sleep time: 00:00:00 [01-01 08:22:02.191] ylog.start success - up time: 00:03:17, idle time: 00:04:41, sleep time: 00:00:00 [01-01 08:22:13.044] ylog.start success - up time: 00:00:04, idle time: 00:00:09, sleep time: 00:00:00
 [01-01 08:28:35.088] ylog hcidump start
[01-01 08:29:31.449] clear last_ylog /storage/BE60-0FE5/ylog/last_ylog

 [01-01 08:29:31.978] clear all ylog /storage/BE60-0FE5/ylog/ylog
[01-01 08:29:31.988] ylog.stop with signal 15, Terminated, sdcard is online
[01-01 08:29:32.100] ylog.start success - up time: 00:07:23, idle time: 00:08:52, sleep time: 00:00:00
 [01-01 08:32:11.281] ylog hcidump start
[01-01 08:37:24.808] ylog.start success - up time: 00:15:16, idle time: 00:16:49, sleep time: 00:00:00
[01-01 08:38:24.745] ylog.start success - up time: 00:16:16, idle time: 00:17:51, sleep time: 00:00:00
 [01-01 08:53:12.028] clear last_ylog /storage/BE60-0FE5/ylog/last_ylog [01-01 08:53:14.542] clear all ylog /storage/BE60-0FE5/ylog/ylog [01-01 08:53:51.364] clear last_ylog /storage/BE60-0FE5/ylog/last_ylog /storage/BE60-0FE5/ylog/last_ylog
[01-01 08:53:51.582] clear all ylog and reboot /storage/BE60-0FE5/ylog/ylog
```

tracer 读取/d/tracing/trace_pipe 数据切片存储,允许内核对时间要求苛刻的驱动模块(比如:usb)添 加调试 log 调整 quota 值

10、traces

用于收集发生 native crash 时的 tombstones 信息和发生 anr 时的 traces 堆栈信息

开放 ylog 网络 socket 端口,接收来自 ylog_benchmark 评测软件发送大数据,用来查找软件和系统瓶颈

13、sys_info_manual

手动触发 ylog 抓取 "busybox netstat -ap"和"ps -t"的执行结果

2.3 ylog 属性列表

1、以下属性值表明各类 log 的运行状态

[ylog.svc.android_crash]: [running]

[ylog.svc.android_events]: [running]

[ylog.svc.android_main]: [running]

[ylog.svc.android_radio]: [running]

[ylog.svc.android_system]: [running]

[ylog.svc.kernel]: [running]

[ylog.svc.tcpdump]: [stopped]

[ylog.svc.hcidump]: [stopped]

[ylog.svc.info]: [stopped]

[ylog.svc.journal]: [running]

[ylog.svc.socket]: [running]

[ylog.svc.sys_info]: [running]

[ylog.svc.sys_info_manual]: [stopped]

[ylog.svc.tracer]: [running]

[ylog.svc.traces]: [running]

[ylog.svc.ylog_debug]: [running]

2、ylog service 总开关控制

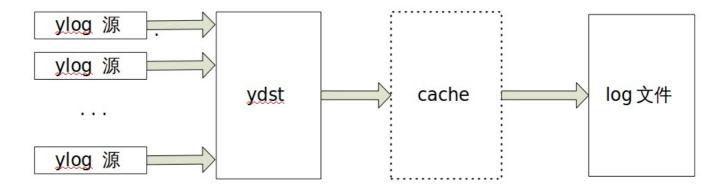

[persist.ylog.enabled]: [1]

3、t卡被卸载次数

[ylog.killed]: [0]

2.4 ylog 功能

- 1、易于后期维护,抽象出3个数据模型:ylog,ydst和cache
- 2、cache 来缓解常规情况下磁盘压力和大数据吞吐下 log 丢失
- 3、filter 关键字过滤,能够对接收数据进行检索,并触发相应动作响应:执行 shell 或者其他操作收集更 多信息,更有效的辅助问题定位(让ylog系统更加smart的做实时分析和环境捕获)
- 4、根据磁盘实际剩余空间分配 log 文件写入上限, 动态调整 quota 值

```
ydst <sys_info/> resize_segment from:
quota 200.00M -> 4.62G
max_segment_size 50.00M -> 50.00M (50.00M)
max_segment 1 -> 8 (5)
max_size 50.00M -> 400.00M (250.00M)
shrinked_segments=0/1
[02-18 11:54:05.909] ylog<critical> All ydst has finished resize: quota 200.00M -> 4.62G
[02-18 11:54:05.909] ylog<critical> All ydst has finished resize: quota 200.00M -> 4.62G
[02-18 11:54:05.909] ylog<info> create /storage/32DB-1D43/ylog/ylog/kernel/analyzer.py
[02-18 11:54:05.960] ylog<info> create /storage/32DB-1D43/ylog/ylog/android/analyzer.py
[02-18 11:54:05.960] ylog<info> create /storage/32DB-1D43/ylog/ylog/android/analyzer.py
[02-18 11:54:05.969] ylog<info> create /storage/32DB-1D43/ylog/ylog/android/analyzer.py

                                                                                                                                                                                                                                                                                           7.18% ydst
                                                                                                                                                                                                                                                                                                                                                                 traces/
                                                                                                                                                                                                                                                                                                                                                                                                                  size 340.00M
                                                                     [02-18 11:54:06.027]
                                                                                                                                                                                                                                                                                                                                   ydst sys_info/ size 400.00M
                                                                                                                                                                                                           ylog<info>
                                                                                                                                                                                                                                                                                          8.45%
```

5、对 ylog 进程状态监控,journal 日志永久性存储到/data/ylog /ylog_journal_file 来辅助分析系统行为

```
root@sp7731g_1h10:/storage/32DB-1D43/ylog/ylog/android # cat /data/ylog/ylog_journal_file
[02-17 22:43:34.685] ylog.start success - up time: 00:02:09, idle time: 00:02:14, sleep time: 00:00:00
[02-18 11:53:34.080] ylog.stop with signal 15, Terminated, sdcard is offline
[02-18 11:53:34.344] ylog.start success - up time: 13:12:09, idle time: 12:25:04, sleep time: 00:01:16
[02-18 13:07:34.825] ylog.start success - up time: 00:00:07, idle time: 00:00:18, sleep time: 00:00:00
```

6、ylog_cli speed 查询自运行以来最快的 10 次吞吐信息:log 产生速率

```
Transfered 3.72G Has run 00 day 01:15:01 avg_speed=867.17K/s
01. [02-18 14:06:58.600] ~ [02-18 14:06:59.600] 00 day 00:59:25 ago 20.02M/s
   [02-18 14:08:01.618] ~ [02-18 14:08:02.618] 00 day 01:00:28 ago 20.02M/s
   [02-18 14:06:10.585] ~ [02-18 14:06:11.585] 00 day 00:58:37 ago 20.01M/s
   [02-18 14:08:10.620] ~ [02-18 14:08:11.620] 00 day 01:00:37 ago 20.01M/s
05. [02-18 14:06:09.585] ~ [02-18 14:06:10.585] 00 day 00:58:36 ago 20.01M/s
06. [02-18 14:05:44.579] ~ [02-18 14:05:45.579] 00 day 00:58:11 ago 20.01M/s
07. [02-18 14:06:41.593] ~ [02-18 14:06:42.593] 00 day 00:59:08 ago 20.01M/s
08. [02-18 14:07:59.617] ~ [02-18 14:08:00.617] 00 day 01:00:26 ago 20.01M/s
09. [02-18 14:05:58.582] ~ [02-18 14:05:59.582] 00 day 00:58:25 ago 20.01M/s

```

- 7、内置 analyzer.py, 用来离线数据处理
- 8、多个数据可以同时输出到一个 ydst 中,保证所有 log 时间戳都在同一时间窗体内
- 9、通过 ylog_cli kernel 可以实时获取 kernel log,最多支持 4 个独立 ylog_cli 同时操作

```
9、通过ylog_cli kernel 可以实时获取 kernel log,最多支持4个独立ylog_cli 同时操作

130|root@sp9830a_5h10_volte:/system/bin # ylog_cli kernel

```

- 11、sys info 每 2 分钟执行系统信息统计收集操作,数据被切片存储
- 12、评测磁盘读写速率和 ylog 可读写数据速度瓶颈上限:ylog_cli benchmark

```
root@sp9830a_5h10_volte:/system/bin # ylog_cli benchmark
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 9.28M/s
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 5.77M/s
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 4.96M/s
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 5.38M/s
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 3.85M/s
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 3.95M/s
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 4.81M/s
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 3.96M/s
cmd_benchmark -> /storage/90D5-BAE2/ylog/ylog/socket/open/000 speed 5.33M/s
```

13、tracer 读取/d/tracing/trace_pipe 数据切片存储,允许内核对时间要求苛刻 的驱动模块(比如:usb)添加调试 log 调整 quota 值

3. ylog_cli 命令行

可通过 adb shell ylog_cli 命令获取 ylog_cli 命令行帮助信息。 === [ylog server supported commands] === kernel -- read kernel log kernel -- execute shell command, ex. ylog_cli -c ls / or ylog_cli -c top -- flush all the data back to disk -- 0:error, 1:critical, 2:warn, 3:info, 4:debug flush -- max speed since ylog start speed time -- show the time info -- list all existing ylog, also can start or stop it, ex. ylog ylog_cli ylog ylog_cli ylog kenrel show each ylog short description
 show ylog kernel detailed description ylog_cli ylog all ylog_cli ylog all stop ylog_cli ylog all start - show each ylog detailed description
- turn off all running ylog
- turn on the previous all running ylog
- turn off the kernel ylog
- turn on the kernel ylog ylog_cli ylog kernel stop ylog_cli ylog kernel start ylog_cli ylog kernel get started - get the running status of kernel ylog ylog_cli ylog kernel timestamp 1 - 1 with timestamp, 0 without ylog_cli ylog kernel bypass 1 - 1 just read, not store to disk or cache, 0 store ylog_cli ylog kernel ydst max_segment 5 - ajust ydst segments to 5
ylog_cli ylog kernel ydst max_segment_size 20 - ajust ydst each segment size to 20M
ylog_cli ylog kernel ydst segment_size 5 20 - ajust ydst segments to 5, size to 20M
ylog_cli ylog kernel cache bypass 1 - data in the cache, 1 droped, 0 save to disk
ylog_cli ylog kernel cache timeout 500 - cacheline timeout to 500ms ylog_cli ylog kernel cache temedul 500 - Cachetthe temedul to 500ms
ylog_cli ylog kernel cache debuglevel 0x03 - bit0: INFO, bit1: CRITICAL, bit7: Dr
-- change log path, named 'ylog' will be created under it, ex. ylog_cli cpath /sdcard/
-- give a new quota for the ylog (unit is 'M') 500M ex. ylog_cli quota 500
-- last_ylog, remove the last_ylog folder
-- all ylog, remove the last_ylog folder and also all the current saved ylog
-- all ylog and restart, remove last_ylog and ylog folder, then restart ylog service - bit0: INFO, bit1: CRITICAL, bit7: DATA quota rylog ryloga rylogr space -- check ylog root folder and last_ylog the size of taking up freespace -- check ylog root folder free size left now isignal -- 1:ignore signal, 0:process signal(default)
benchmark -- while (1) write data to ylog/socket/open/ without timestamp
benchmarkt -- while (1) write data to ylog/socket/open/ with timestamp benchmarkt -- While (1) write data to ylog/socket/open/ with timestamp

test -- test from android

rootdir -- get the log disk root dir

cpath_last -- get the last_ylog path

history_n -- set keep_historical_folder_numbers

setprop -- set property, ex. ylog_cli setprop persist.ylog.enabled 1

at -- send AT command to cp side, ex. ylog_cli at AT+ARMLOG=1 or ylog_cli at AT+CGMR

print2android -- write data to android system log print2kernel -- write data to kernel log

3.1 ylog_cli 命令行概览

3.2 ylog_cli 命令行说明

ylog_cli 通过 socket 方式与 ylog 进程进行通信,支持多类命令行,可分为:查询类、开关类、设置类、删除类和其他。

3.2.1 查询类命令行

- 1、查询 ylog 进程从启动以来的速度前 10 名
- 2、查询各类 log 开关状态,段上限值、单个段大小上限值、log 传输量

```
[ransfered 7.08M Has run 00 day 00:24:41] avg_speed=4.89K/s
01. [01-01 08:00:10.818] ~ [01-01 08:00:11.818] 00 day 00:00:09 ago 359.87K/s
02. [01-01 08:00:19.838] ~ [01-01 08:00:20.847] 00 day 00:00:18 ago 261.90K/s
03. [01-01 08:00:18.838] ~ [01-01 08:00:19.838] 00 day 00:00:17 ago 201.25K/s
04. [01-01 08:24:24.362] ~ [01-01 08:24:25.363] 00 day 00:24:23 ago 182.42K/s
05. [01-01 08:04:39.867] ~ [01-01 08:04:40.868] 00 day 00:04:38 ago 182.17K/s
06. [01-01 08:16:43.176] ~ [01-01 08:16:44.176] 00 day 00:16:41 ago 180.07K/s
07. [01-01 08:02:39.823] ~ [01-01 08:02:40.823] 00 day 00:02:38 ago 180.04K/s
08. [01-01 08:18:43.227] ~ [01-01 08:18:44.227] 00 day 00:18:41 ago 178.38K/s
09. [01-01 08:12:42.063] ~ [01-01 08:12:43.063] 00 day 00:12:40 ago 177.89K/s
10. [01-01 08:08:40.959] ~ [01-01 08:08:41.959] 00 day 00:08:39 ago 177.69K/s
```

命令格式: adb shell ylog_cli ylog

响应格式:

root:显示当前 log 的存储路径 quota:log 存储空间上限值 running:表示 ylog 运行时间

3、查询单个 log 开关状态(同 ylog.svc.xxx)

命令格式:ylog_cli ylog xxx get started

响应格式为: 打开状态: 1\n 关闭状态: 0\n

注:xxx 可分别为:android_main android_system android_radio android_events android_crash

tcpdump hcidump kernel

4、查询 log 存储路径

命令格式: adb shell ylog_cli cpath

响应格式: 不插 t 卡时:

/data/ylog/ylog 内部存储不支持保存历史 log

插 t 卡时:

/storage/BE60-0FE5/ylog/ylog /storage/BE60-0FE5/ylog/last_ylog

5、查询 log 空间占用情况

命令格式: adb shell ylog cli space

响应 格式:

```
SPREADTRUM\yanli.chen@yanlichenubtpc:~/tmp/ylog/android/test$ adb shell ylog_cli space
12.31G (quota) quota 大小
/storage/1A19-EA5B/ylog/ylog -> 13.65G (freespace) t卡剩余空间
730M /storage/1A19-EA5B/ylog/last_ylog last log 占用情况
19M /storage/1A19-EA5B/ylog/ylog 当前log总量
```

6、 查询 log 所在磁盘剩余空间

命令格式: adb shell ylog_cli freespace

响应格式:

/storage/BE60-0FE5/ylog/ylog -> 7.32G

7、查询 log 所在磁盘路径

命令格式: adb shell ylog cli rootdir

响应格式:

/storage/BE60-0FE5

8、查询历史 log 保留次数

命令格式:adb shell ylog_cli history_n 响应格式:5\n 默认保留 5 次历史 log

9、查询单个ylog源的相关信息

```
root@sp9830a_5h10_volte:/ # ylog_cli ylog android_main
root = /storage/BE60-0FE5/ylog/ylog, quota = 6.58G, running 00 day 00:15:47
[ android_main ] = running {
   .loglevel = 3
   .file = logcat -v threadtime -b main
   .restart_period = 2000
    .timestamp = 0
    .bypass = 0
    .mode = 194
    .ydst = 764.78K/2.33M {
        .file = /storage/BE60-0FE5/ylog/ylog/android/000
        .max_segment = 80
        .max_segment_size = 50.00M
        .cache= {
            .size = 512.00K
            .num = 4
            .bypass = 0
            .timeout = 1000ms
            .debuglevel = 0x02
   }
```

命令格式: adb shell ylog_cli ylog xxx

响应格式:输出 ylog 源的输入类型、存储路径、cache 大小等信息

注:xxx 可分别为:android_main android_system android_radio android_events android_crash tcpdump hcidump kernel

10、查询所有 log 相关信息

命令格式: adb shell ylog_cli ylog all

响应格式:输出所有 log 的输入类型、存储路径、cache 大小等信息

3.2.2 开关类命令行

1、ylog 总开关设置

命令行格式:

start ylog 进程:adb shell setprop persist.ylog.enabled 1 ----> persist.ylog.enabled 1 stop ylog 进程:adb shell setprop persist.ylog.enabled 0 ----> persist.ylog.enabled 0

2、所有 log 开关统一设置

命令格式:adb shell ylog_cli ylog all start/stop

响应格式:输出所有 log 的开关状态、存储路径、cache 大小等信息

3、单个log 开关设置

命令格式:adb shell ylog_cli ylog xxx start/stop

响应格式:输出该 log 的数据结构信息

```
SPREADTRUM\yanli.chen@yanlichenubtpc:~/whale2/device/sprd/whale2/common$ adb shell ylog_cli ylog_ kernel stop
oot = /storage/BE60-0FE5/ylog/ylog, quota = 6.58G, running 00 day 00:35:28
 kernel ] = stopped {
   .loglevel = 3
   .file = /proc/kmsg
.restart_period = 300
    .timestamp = 1
   .bypass = 0
    .mode = 194
    .ydst = 1.14M/1.14M {
        .file = /storage/BE60-0FE5/ylog/ylog/kernel/000
.max_segment = 3
        .max_segment_size = 50.00M
        .cache= {
            .size = 512.00K
            .num = 2
            .bypass = 0
            .timeout = 1000ms
            .debuglevel = 0x02
```

3.2.3 设置类命令行

1、设置 log 段数最大值

命令格式:adb shell ylog_cli ylog xxx ydst max_segment n

响应格式:输出 log 的数据结构信息

```
root@sp9830a_5h10_volte:/  # ylog_cli ylog kernel ydst max_segment 3
root = /storage/BE60-0FE5/ylog/ylog, quota = 6.58G, running 00 day 00:30:48
[ kernel ] = running {
    .loglevel = 3
    .file = /proc/kmsg
    .restart_period = 300
    .timestamp = 1
    .bypass = 0
    .mode = 194
    .ydst = 1.01M/1.01M {
        .file = /storage/BE60-0FE5/ylog/ylog/kernel/000
        .max_segment = 3
        .max_segment_size = 50.00M
        .cache= {
            .size = 512.00K
            .num = 2
            .bypass = 0
            .timeout = 1000ms
            .debuglevel = 0x02
        }
    }
```

2、设置 log 单个文件大小,单位为:M

命令行格式:adb shell ylog_cli ylog xxx ydst max_segment_size 20

响应格式:输出 log 的数据结构信息

```
root = /storage/BE60-0FE5/ylog/ylog, quota = 6.58G, running 00 day 00:40:45
kernel ] = stopped {
   .loglevel = 3
   .file = /proc/kmsg
   .restart_period = 300
   .timestamp = 1
   .bypass = 0
   .mode = 194
   .ydst = 1.14M/1.14M {
      .file = /storage/BE60-0FE5/ylog/ylog/kernel/000
      .max_segment = 3
      .max_segment_size = 100.00M -->
      .cache= {
          .size = 512.00K
          .num = 2
          .bvpass = 0
          .timeout = 1000ms
          .debuglevel = 0x02
      }
```

3、同时设置 log 段数最大值和单段 log 大小上限值

命令格式: adb shell ylog_cli ylog xxx ydst segment_size 5 20

响应格式:输出 log 的数据结构信息

```
root = /storage/BE60-0FE5/ylog/ylog, quota = 6.58G, running 00 day 00:48:33
kernel ] = stopped {
   .loglevel = 3
   .file = /proc/kmsg
   .restart_period = 300
   .timestamp = 1
   .bypass = 0
   .mode = 194
   .ydst = 1.14M/1.14M {
      .file = /storage/BE60-0FE5/ylog/ylog/kernel/000
      .max_segment = 6
      .max_segment_size = 25.00M
      .cache= {
          .size = 512.00K
          .num = 2
          .bypass = 0
          .timeout = 1000ms
          .debuglevel = 0x02
   }
```

4、设置通过 ylog_cli 命令行实时打印 kernel log 时是否打印时间戳

命令格式: adb shell ylog_cli ylog kernel timestamp 1/0

1:打印时间戳0:不打印时间戳

响应格式:终端实时打印 kernel log

```
:3>[10723.297851] c0
                                                        [01-01 11:02:11.970] <6>[10908.007995] c0 sprdi

 3>[10728.055267]
                          c0 [SDIOTRAN]set m
```

5、设置 log 是否回写磁盘

命令格式:adb shell ylog_cli ylog xxx bypass 1/0

1:回写磁盘 0:不写入磁盘

响应格式:输出 log 的数据结构信息 root@sp9830a_Sh10_volte:/ # ylog_cli ylog kernel cache bypass 0 root = /storage/BE60-0FE5/ylog/ylog, quota = 6.58G, running 00 day 01:20:54 kernel] = running { .loglevel = 3 .file = /proc/kmsg .restart_period = 300 .timestamp = 1.bypass = 1.mode = 194.ydst = 1.47M/1.47M { .file = /storage/BE60-0FE5/ylog/ylog/kernel/000 .max segment = 6.max segment size = 25.00M .cache= { .size = 512.00K.num = 2.bypass = 0.timeout = 1000ms .debuglevel = 0x02} }

6、 设置 cache timeout 时间

命令格式: adb shell ylog cli ylog xxx cache timeout 500

响应格式:输出 log 的数据结构信息

7、设置历史 log 保留个数

命令格式: adb shell log_cli history_n N

响应格式:N\n

3.2.4 删除类命令行

1、只删除 last_ylog

命令格式: adb shell ylog_cli rylog

响应格式: done\n

2、删除 ylog 和 last_ylog 文件夹

命令格式: adb shell ylog_cli ryloga

响应格式:done\n

3、删除 ylog 和 last_ylog 文件夹,并重启 ylog 进程

命令格式: adb shell ylog_cli rylogr

响应格式:done\n

3.2.5 其他命令行

1. 获取实时 kernel log

命令格式:adb shell ylog_cli kernel 响应格式:打印实时 kernel log

```
SPREADTRUM\yanli.chen@yanlichenubtpc:~/whale2/vendor/sprd/proprietories-source/ylog$ adb shell date
Sun Jan 1 08:46:04 CST 2012

SPREADTRUM\yanli.chen@yanlichenubtpc:~/whale2/vendor/sprd/proprietories-source/ylog$ adb shell ylog_cli kernel
[01-01 08:46:07.340] <4>[ 2746.664031] c0 sensor id:0, rawdata:0x31a, temp:31223
[01-01 08:46:07.340] <4>[ 2748.082366] c0 _sprdchg_timer_interrupt
[01-01 08:46:07.350] <6>[ 2748.082396] c0 sprdbat: sprdbat_charge_works-start
[01-01 08:46:07.351] <4>[ 2748.082519] c0 sprdchg_get_chg_cur rawdata * 50+300=450
[01-01 08:46:07.351] <6>[ 2748.082550] c0 sprdbat: enter sprdbat_auto_switch_cur avg_cur=89,chg_cur=450
[01-01 08:46:07.351] <6>[ 2748.082580] c0 sprdbat: chg_end_vol_l:0x105e
[01-01 08:46:07.351] <3>[ 2748.083496] c0 chg_current warning...isense:4169...vbat:4183
```

2、将 cache 中内容刷新到磁盘

命令格式: adb shell ylog_cli flush

响应格式:无

```
oot = /storage/BE60-0FE5/ylog/ylog, quota = 6.58G, running 00 day 01:22:34-
 kernel ] = running {
    .loglevel = 3
    .file = /proc/kmsg
    .restart_period = 300
    .timestamp = 1
    .bypass = 1
    .mode = 194
    .vdst = 1.47M/1.47M {
        .file = /storage/BE60-0FE5/ylog/ylog/kernel/000
        .max_segment = 6
        .max_segment_size = 25.00M
        .cache= {
            .size = 512.00K
            .num = 2
            .bvpass = 0
            .timeout = 200ms
            .debuglevel = 0x02
3、评测磁盘读写速率 benchmark 测试
a. 不加时间戳的 benchmark 测试:
命令格式:adb shell ylog_cli benchmark
相应格式:
root@sp9830a_5h10_volte:/storage/BE60-0FE5/ylog # ylog_cli benchmark
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 4.40M/s
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 4.18M/s
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 5.77M/s
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 5.03M/s
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 5.14M/s
b. 加时间戳的 benchmark 测试
命令格式:adb shell ylog_cli benchmarkt
相应格式:
130|root@sp9830a 5h10 volte:/storage/BE60-0FE5/ylog                          # ylog cli benchmarkt
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 1.71M/s
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 1.77M/s
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 2.18M/s
cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 1.99M/s
```

4、通过 ylog_cli 命令行写 kernel log

命令格式:adb shell ylog_cli print2kernel log 内容 例如: adb shell ylog_cli print2kernel test 通过 adb shell cat /dev/ksmg |grep print2 可看到 log 成功写入/dev/kmsg 节点

SPREADTRUM\yanli.chen@yanlichenubtpc:~/6.0/device/sprd\$ adb shell ylog_cli print2kernel test SPREADTRUM\yanli.chen@yanlichenubtpc:~/6.0/device/sprd\$ adb shell cat /dev/kmsg |grep print2 12,4549,312735198,-;print2kernel test

cmd_benchmark -> /storage/BE60-0FE5/ylog/ylog/socket/open/000 speed 1.65M/s

5、通过 ylog_cli 命令行写 android log

命令格式: adb shell ylog_cli print2android log 内容 例如: adb shell ylog_cli print2android test 通过 adb logcat |grep print2 可看到 log 成功写入

```
SPREADTRUM\yanli.chen@yanlichenubtpc:~/Downloads$ adb shell ylog_cli print2android xxxxxxxxx

SPREADTRUM\yanli.chen@yanlichenubtpc:~/Downloads$ adb logcat |grep print2

03-29 17:24:06.707 410 519 W YLOG : [03-29 17:24:06.707] ylog<debug> command is: print2android xxxxxxxxx

03-29 17:24:06.707 410 519 W YLOG : [03-29 17:24:06.707] ylog<warn> print2android xxxxxxxxx
```

3.2.6 统计 modem/wcn log 速率

ylog 可对 modem log、wcn log 进行速率统计,并将相关 log 存储在 cp 文件夹中。

```
cp_5mode modem log -> running -> cp/5mode/000 (1x10.00M/10.00M, 5.00%) -> cache.cp/5mode/(8x512.00K) [76.49M/76.49M] cp_wcn log -> running -> cp/wcn/000 (1x10.00M/10.00M, 5.00%) -> cache.cp/wcn/(2x512.00K) [18.88M/18.88M]
```

ylog 从对应节点拿到 modem log 后,缓存在 8*512*1024 大小的 cache 中,待 timeout 时间或 cache 填满后,将 log 写入磁盘。所以理论上,在 modem log 速率不超过 4M/s 的情况下,ylog 存储的 modem log 不会出现 log 丢失问题。

1. modem log 速率统计

可通过 adb shell ylog_cli speed 对各类 log 速率进行统计,其中 modem log 速率如下:

```
[ylog] cp_5mode modem log -> 20.44% 36.70M > log total log speed top 5
01. [04-01 11:04:32.379] ~ [04-01 11:04:33.380] 00 day 17:19:38 ago 1024.00K/s
02. [04-01 11:04:34.381] ~ [04-01 11:04:35.381] 00 day 17:19:40 ago 1024.00K/s
03. [04-01 11:04:35.381] ~ [04-01 11:04:36.382] 00 day 17:19:41 ago 1024.00K/s
04. [04-01 11:04:37.383] ~ [04-01 11:04:38.383] 00 day 17:19:43 ago 1024.00K/s
05. [04-01 11:04:39.385] ~ [04-01 11:04:40.385] 00 day 17:19:45 ago 1024.00K/s
```

2. wcn log 速率统计

可通过 adb shell ylog_cli speed 对各类 log 速率进行统计,其中 wcn log 速率如下:

```
[ylog] cp wcn wcn log -> 3.20% 838.00K > log total log speed top 5
01. [04-01 11:52:39.726] ~ [04-01 11:52:40.735] 00 day 00:02:16 ago 17.82K/s
02. [01-01 08:05:49.509] ~ [01-01 08:05:50.509] 00 day 00:01:55 ago 17.00K/s
03. [04-01 11:52:57.743] ~ [04-01 11:52:58.743] 00 day 00:02:34 ago 16.00K/s
04. [04-01 11:55:57.838] ~ [04-01 11:55:58.838] 00 day 00:05:35 ago 16.00K/s
05. [01-01 08:06:08.533] ~ [01-01 08:06:09.533] 00 day 00:02:14 ago 15.00K/s
```

3. ylog 可发送 at 命令

ylog_cli 命令行可发送裸 at 命令

命令格式:adb shell ylog_cli at at 命令 例如: adb shell ylog_cli at at+armlog=1 响应格式:

a. 若是 engpc 通道打开:

Try to stop engpc:

getprop | grep init.svc.engpc | cut -d '.' -f 3 | cut -d ']' -f 0

or

stop engpcclientt; stop engpcclientlte; stop engpcclienttl; stop engpcclienttl; stop engpcclienttlf pcclientlte; stop engpcclientw; stop engpcclienttl; stop engpcclienttl

可通过 adb shell getprop | grep init.svc.engpc | cut -d '.' -f 3 | cut -d ']' -f 0 或

adb shell stop engpcclientt; stop engpcclientlte; stop engpcclientw; stop engpcclienttl; stop engpcclientlf

命令关闭 engpc 通道

b. 若是 engpc 通道关闭:

```
SPREADTRUM\yanli.chen@yanlichenubtpc:~/Downloads$ adb shell ylog_cli print2android xxxxxxxxx

SPREADTRUM\yanli.chen@yanlichenubtpc:~/Downloads$ adb logcat |grep print2

03-29 17:24:06.707 410 519 W YLOG : [03-29 17:24:06.707] ylog<debug> command is: print2android xxxxxxxxx

03-29 17:24:06.707 410 519 W YLOG : [03-29 17:24:06.707] ylog<warn> print2android xxxxxxxxx
```

返回: at 命令的返回值

4. ylog 后期 log 分析方法和技巧

4.1 ylog 目录结构

不插 t 卡时,ylog 存储在 data 分区中,默认 quota 值为 200M,data 分区只保留本次 log,不保留历史 log。当插上 t 卡挂载成功后,会计算 t 卡的可用空间,将可用空间的 90%作为 ylog 的 quota 值,用来动态分配给各个 ydst。同时将 data 分区下的 log move 到 t 卡中,以追加方式存储后续 log。当磁盘空间不足时,ylog 会尝试缩小自身,尽量释放更多空间存储后续 log,或为自己设置新的磁盘配额空间,动态调整自己,以新的配额大小规划 ydst 段数或段大小。

插有 t 卡时,在 t 卡挂载状态不出现异常和不重启 ylog 总开关的情况下,ylog 会将上次手机运行周期内的 log 存储到 last_ylog 文件夹中,并重命名为 ylog1,同时将上上次手机运行周期内的 log 重命名为 ylog2,依次类推,默认最多保留 5 次历史 log,可通过 adb shell ylog_cli history_n N 命令将历史 log 个数设置为 N 次。t 卡中 ylog 存储的 log 目录结构为:

```
last_ylog
ylog
    android
       - 000
        analyzer.py
        outline
    hcidump
       000
        analyzer.py
    info
    kernel
        000

        outline
    ylog_debug
    ylog_journal_file
```

其中 000 为当前 log 存储文件,当 000 大小达到 log 单个文件大小上限值时,会翻转为 001,并新建 000 用来继续存储 log,数字越小,表示 log 越新。当 log 文件达到翻转上限时,会根据 ydst 的属性,判断是停止存储 log 以保留原始 log,还是进行将最老的 log 删除来释放空间 analyzer.py 脚本为 log 离线解析文件,支持 windows/MAC/linux 等多个平台

outline 文件记录每段 log 的起止时间和填满该段 log 所用时间。在分析问题时,可根据问题发生时间点直接定位对应段 log,用 vim 打开 outline 文件,可以快速打开发生问题时间区间内的文件,详细步骤如下:vim outline

- 1. 光标定位到 002
- 2. 然后输入 gf
- 3. 就可以直接打开对应 002 文件

```
002 - 2012.01.01 08:00:06 ~ 2012.01.01 14:47:00 [00 06:46:54]

001 - 2012.01.01 14:47:00 ~ 2012.01.01 14:48:31 [00 00:01:31]

000 - 2012.01.01 14:48:31 ~
```

Log 内容中包含的信息:

其中 0 表示该文件为第 000 文件, 54 表示最多可以产生 54 段

50.00M 表示每段文件最多存储 50M 大小数据

```
A0[ylog_segment=0/54,50.00M] 2016.02.18 14:58:27 -00d00:00:01/1551ms 0.00B/2.<u>64G 0.00B/s</u>

4.2 ylog 文件离线解析

analyzer.py 中包含 token 映射信息

'A0':'main.log',

'A1':'system.log',

'A2':'radio.log',

'A3':'events.log',

'A4':'crash.log',

将 ylog pull 到本地,在对应文件夹目录中执行 python analyzer.py,就可以拿到解析后的 log,目前解析支持将 log 合并和拆分,可根据自身需求进行定制解析。另外,离线解析还支持指定段解析,例如:执行 python analyzer.py 000 001,就可以单独解析 000 001 这两段 log。

```
SPREADTRUM\yanli.chen@yanlichenubtpc:~/tmp/ylog/android/test$ python analyzer.py 000 001
SPREADTRUM\yanli.chen@yanlichenubtpc:~/tmp/ylog/android/test$ ll
total 7424
5 19:23 ./
                                                           4096 Mar

```

解析后的 log 目录为:

```
android
  - 000
    analyzer.py
    crash.log
    events.log
    main.log
   outline
   radio.log
   system.log
hcidump
  - 000
    analyzer.py
    hcidump.log
info
kernel
    000
    analyzer.py
    kernel.log
  — outline
sys_info
    000
  analyzer.py
   outline
   sys_info.log
tcpdump
  - 000
    analyzer.py
    outline
    tcpdump.log
tracer
   000
    analyzer.py
  - outline
  tracer.log
traces
  - 000
    analyzer.py
   - outline
   traces.log
ylog debug
ylog_journal_file
```

4.3 native crash 和 anr log 分析方法

1. native crash 分析方法

a. 进入/ylog/ylog/traces 目录,执行: python analyzer.py, vim traces.log,搜索 ylog_tombstones, 例如:

ylog_tombstones 001 [cat /data/tombstones/tombstone_00] [01-02 02:14:16.785] 时间戳[01-02 02:14:16.785]即是 native crash 时间点

b. 进入 android 目录,vim outline,找到以上发生 native crash 时间点所在段例如:01-02 02:14:16.785 该时间点在以下时间段内,对应 log 段数为:015 015 - 2012.01.02 02:12:36 ~ 2012.01.02 02:40:37 [00 00:28:01]

c. 解析出该 log 段包含的 main,system,events,radio,crash 等 log

执行: python analyzer.py 015

回车即生成: crash.log events.log main.log radio.log system.log

- d. 打开对应 xxx.log,即可进行问题分析
- 2. anr 分析方法
- a. 进入/ylog/ylog/traces 目录,执行: python analyzer.py, vim traces.log,搜索 ylog_traces,例如:

ylog_traces 001 [cat /data/anr/traces.txt] [01-02 04:07:43.903] 时间戳[01-02 04:07:43.903]即是 anr 时间点

b. 进入 android 目录,vim outline,找到以上发生 anr 时间点所在段例如:01-02 04:07:43.903 该时间点在以下时间段内,对应 log 段数为:011

011 - 2012.01.02 04:04:04 ~ 2012.01.02 04:29:18 [00 00:25:14]

c. 解析出该 log 段包含的 main,system,events,radio,crash 等 log

执行: python analyzer.py 011

回车即生成: crash.log events.log main.log radio.log system.log

- d. 打开对应 xxx.log,即可进行问题分析
- 3.系统状态相关 log 分析(每 2 分钟收集一次系统相关 log 信息)

方法一:

进入 ylog/ylog/sys_info 目录,执行:python analyzer.py, 回车即可生成:sys_info.log(整个测试过程收集到的全部系统 log) 方法二:

- a. 找到问题发生时间点
- b. 进入 ylog/ylog/sys_info 目录, vim outline, 找到以上发生问题时间点所在段
- c. 打开对应 log 段,分析问题发生时间点前后的系统状态
